Versatility and Compatibility Headline AMREL's All-New UniSOL Line of Rugged Products

October 27, 2004, ARCADIA, Calif. - AMREL/AMERICAN RELIANCE, INC. presents its all-new UniSOL Line (Universal Solution) of non-proprietary Ultra-High Brightness Displays, Fully Rugged Keyboards and other rugged computing programs that are designed to work with AMREL equipment, as well as interfacing with different systems that organizations already have in place. The Line will continue to grow as additional non-proprietary products are developed to meet organizations' ever-expanding rugged mobile computing needs.

"The versatility of AMREL's UniSOL Line makes it the premiere choice for those in need of a low-cost solution to their rugged needs," said Yusi Ho, AMREL's Director of Sales. "The units have passed some of the military's toughest tests against extreme weather, vibration, dust and humidity."

From field operators who utilize our docking station to "dock" their tablet in their vehicles for increased mobile functionality; to vehicles that use our Power Stop program to protect sensitive digital information by conducting a controlled shut down of the on-board mobile computer, the UniSOL Line has something for everyone. Additional benefits include:

- Employee downtime is reduced as they don't have to take the time to learn how to operate an entirely new system.
- Purchasing a rugged unit that can be quickly integrated into an existing system provides organizations with a low-cost solution to their situation.
- Downtime is also reduced for IT divisions, as they don't have to rebuild a brand new system.

AMREL's Ultra-High Brightness Displays can be used with any manufacturer's computer that has a RGB interface. The displays are sunlight readable, have a standard resistive touch screen and a very high brightness of 1200 nits.

The Fully Rugged Keyboard works with any standard USB interface, while the backlit USB keyboard passes the military's IP54 certification for water/dust resistance, as well as being drop resistant up to 75 cm. The 89-key compact design acts like a full size desktop keyboard and includes a built-in Trackpoint.

Power Stop strategically shuts down portable computers in vehicles to put the brakes on dead batteries and massive data loss. It controls the circuits between a vehicle's battery, ignition and the computer's power supply. The unit monitors the vehicle battery for decreasing voltage. If the volts drop below 10.5V for over 30 seconds, Power Stop initiates a controlled shutdown sequence that protects data and keeps the battery from draining. AMREL/AMERICAN RELIANCE, INC.

AMREL/AMERICAN RELIANCE, INC. is responsible for designing, developing and manufacturing high quality programmable power supplies and electronic loads for industrial and military ATE markets. AMERICAN RELIANCE accommodates individual customers needs by offering one of the world's widest selections of programmable power products on the market today, as well as providing custom designs and modifications. High resolution digital artwork is available upon request
